Comment

The Widal test is a serological blood test used for the diagnosis of Typhoid Fever caused by Salmonella typhi. It detects the presence of O (somatic) and H (flagellar) antibodies in the patient's serum. The test is commonly performed when typhoid fever is suspected due to prolonged fever, weakness, abdominal pain, and headache. A significant rise in antibody titer may indicate current or recent infection. However, the Widal test should be interpreted along with clinical findings and other laboratory investigations for accurate diagnosis.
